Syringe 1.x

by April

Documentation

Introduction

Syringe 1 is a tool used for phishing attacks. It utilizes wget and c# for Windows to download a specified file after tricking the target into disabling their antivirus because "the file they downloaded needs the antivirus to be disabled". It downloads a test file to verify the antivirus has been disabled, then, if it is not, prompts the user again. If it is, the legitimate setup runs, as well as the virus. In the Pro version and S Editions (WIP), the program dismantles and destroys other antiviruses.

Editions

Syringe 1 has 3 different versions – Standard, Pro, and Edition. Standard doesn't have any advanced features, like customization and anti-av. It does, however, include basic functions such as phishing and installing the Trojan/virus.

Pro and Edition versions will have a product key system. You may get a licensed copy of the software by emailing de.april@execs.com with a special reason to get it for free or buy it via PayPal.

Usage

Assuming you have your virus link ready and the legitimate executable already downloaded;

The usage of the software is quite straightforward. In the standard version, fill out all the fields (as they are all required) then press begin. Correct any errors given as necessary.

If you do not have your virus link ready, but the legitimate executable is ready;

Upload a file to Dropbox, or another hosting service. Download it. On Firefox, goto your downloads and right click copy download link.
On Chrome, goto your downloads and copy the download link.

If you have neither ready;

Follow the previous steps.
Download any executable file that you know is legitimate, or if your risky, use two viruses.

Files

You can download the file output of older versions (1.0 and 1.1 Betas) (output being example viruses made) HERE:
